## Biographical/Historical note

---

Edward Lawrie Tatum, 1909-1975, a biochemical geneticist, Member and Professor at the Rockefeller University from 1957 until his death in 1975. His field of research was the study of the genetics and metabolism of bacteria, yeast and molds. His research was aimed at a clear understanding of how genes determine, at the molecular level, the characteristics of living organisms. His special interests were the nutrition and metabolism of insects and microorganisms and the biochemistry and genetics of microorganisms. Some of his most significant research results were: identification of thiamine as a growth factor for propionic acid bacteria (with H.G. Wood); isolation and identification of kynurenine as an eye-color hormone in *Drosophila* (with G.W. Beadle); discovery of biochemical mutations in *Neurospora* (with G.W. Beadle); biochemical mutations in bacteria; gene recombination in *Escherichia coli* (with J.S. Lederberg); biosynthesis of tryptophan (with D.M. Bonner).

In 1958 he shared the Nobel prize in medicine and physiology with G.W. Beadle and J. Lederberg for their contributions in biochemical genetics.
