Biographical / Historical

Stanford Moore was born on September 4, 1913 in Chicago, Illinois, to John Howard and Ruth Fowler Moore. Moore grew up in Nashville, Tennessee, where his father was Professor of Law at Vanderbilt University. After attending Peabody Demonstration School, he enrolled at Vanderbilt, graduating with a B.S. in 1935. That same year, he began graduate studies in Chemistry at the University of Wisconsin. Under the supervision of Karl Paul Link, he produced his Ph.D. thesis, "The Identification of Carbohydrates as Benzimidazole Derivatives" in 1938. After obtaining his degree, Link recommended Moore for a research assistantship in the Max Bergmann Laboratory at the Rockefeller Institute for Medical Research. Moore joined the Bergmann Laboratory in 1939, where he met his colleague and research partner of forty years, William H. Stein, a member of the laboratory since 1937.

During World War II, Moore served as a Technical Aide with the Office of Scientific Research and Development from 1942 to 1945. When the war ended, Herbert Gasser, then Director of the Rockefeller Institute for Medical Research, offered Moore and Stein laboratory space at the Institute (Bergmann's laboratory no longer existed, as he had died in 1944). In 1945, Moore and Stein returned to the Institute to form the Moore-Stein Laboratory. For over forty years, until his death, Moore was a member of the Rockefeller Institute for Medical Research (later the Rockefeller University). Moore primarily researched in the areas of chromatography and chemistry of carbohydrates, proteins, and amino acids, and had a keen interest in the development of scientific equipment.

In 1950, Moore accepted an invitation to the University of Brussels to be a visiting professor (Chaire Franqui/Francqui Chair), and followed up that appointment with a 6-month stint as an investigator at the University of Cambridge. He became a full Member of the Rockefeller Institute for Medical Research in 1952. Moore, together with Stein, worked to develop quantitative chromatographic methods through which proteins, peptides, and amino acids could be separated.

In 1972, Moore and Stein were awarded the Nobel Prize in Chemistry "for their contribution to the understanding of the connection between chemical structure and catalytic activity of the active centre of the ribonuclease molecule." They shared the award with Christian B. Anfinsen from the National Institutes of Health.

Moore was active in various professional scientific organizations, including the American Society of Biological Chemists (he served as President in 1967 as well as a member of the Editorial Board of the Journal of Biological Chemistry from 1950 to 1960), the Federation of American Societies for Experimental Biology (serving as president in 1971), and the International Union of Pure and Applied Chemistry (he was secretary to the Commission on Proteins of the International Union of Pure and Applied Chemistry from 1953 to 1957. In addition to the Nobel Prize in Chemistry in 1972, Moore (along with Stein) won the 1964 American Chemical Society Award in Chromatography and Electrophoresis, and the Richards Medal and the Linderstrøm-Lang Medal, both in 1972.

Stanford Moore died in his apartment in New York City on August 23, 1982 at the age of sixty-eight.
