Biographical/Historical note

Eugene Lindsay Opie, 1873-1971, was a physician, pathologist and medical administrator. He was a pioneer in investigating the cause of diabetes and was the first person to observe that injury to the cells of the Island of Langerhans caused the disease. Except for the effects of chemicals, he contributed much to the knowledge of tuberculosis and he is credited with pioneer findings in fundamentals aspects of inflammation, necrosis, liver pathology and in pneumonia and influenza epidemics in military camps. The book he wrote on the pancreas was for many years the classic textbook in the field.

Biographical note	
1873	Born July 5 Staunton, Va.
1893	A.B. Johns Hopkins University

1897	M.D. Johns Hopkins University Medical School

Scope and Contents note

This collection consists, primarily, of administrative correspondence from 1904 to 1970, but it is in discreet portions covering only the years during which Dr. Opie was actively involved with The Rockefeller Institute for Medical Research.

Included are groups of photographs covering various activities and a group of portraits.

Included with this collection are seven letter from Wm. Gies for The Society for Experimental Biology and Medicine to Simon Flexner (1907-1908) in which he suggests Dr. Opie as a secretary of the Society to succeed Wm. Gies.
